

FileDownload is exactly what it's name implies. Its the class that is responsible for downloading the selected files.

CSVFile takes the data from the downloaded file and inserts it into lists to be displayed

Category class to determine the data sets to be shown to the user, this data is stored in an arraylist for easy insert and filtering of data

Usermenu is used to show all the contents of the Categories/Api to the user and to recieve user input. Will call Category, FileRead, and API classes to help in displaying the content

FileRead class is used get the file name from where the data lies, and exactly where in the file to read from. Which is then sent to to the API class to be easily stored into an object

API CLASS to store the data into an object for easy data manipulation, is to be sent to the UserMenu to be displayed
